

CAPS owners and AHS owners look roughly similar with respect to their overall household size distributions. The income distribution of CAPS owners is also similar to that of AHS owners, with the exception that only 13% of CAPS owners are in the lowest income bracket ( $< \$20,000$ ), compared with 25% for the CPS, and 34% of CAPS owners were in the \$30-40K income bracket, compared with only 27% of AHS owners.

As with the comparison between CAPS and the CPS, the greatest difference between CAPS owners and the AHS sample concerns geographic coverage. CAPS has very little coverage in the Northeast, and it over-represents the South.
